Clean Version of the Amended Passages in the Specification

The paragraph beginning at page 4, line 13 has been replaced with the following

rewritten paragraph:

Figs. 5A and 5B present bar graphs of epitope mapping showing the binding of

serum from sheep immunized with a peptide that spanned HCV1 E2HV region to 8-mer

overlapping mimotopes that spanned the same region.

The paragraph beginning at page 4, line 18 has been replaced with the following

rewritten paragraph:

Figs. 7A-7C present bar graphs of epitope mapping showing the binding of human

serum albumin, prealbumin, and TBG to overlapping peptides of the E2HV region.

The paragraph beginning at page 30, line 25 has been replaced with the following

rewritten paragraph:

The results of the screening using sheep serum IgG s1634-2 and s1635-2 from

sheep immunized with the conjugated 30-mer are shown in Figs. 5A and 5B. The results

indicate that sheep 1634-2 IgG reacts with the minimum epitope <sup>400</sup>VSLLA<sup>404</sup>. IgG from

sheep 1635-2 has a broader reactivity profile--the sera reacts with the peptides containing

the minimum <sup>400</sup>VSLLA<sup>404</sup> epitope, and in addition, peptides containing the minimum

epitopes 401 SLLAPGA407 and 403 LAPGA407. Thus, the IgG preparation from sheep

immunized with the 30-mer peptide of E2HV is reactive with linear epitope(s) between

amino acids 400 to 407.

The paragraph beginning at page 42, line 28 has been replaced with the following

rewritten paragraph:

Atty Dkt No. PP00938.105 USSN: 08/823,980 PATENT

The binding of three serum proteins, human prealbumin, human serum albumin, and thyroid binding globulin (TBG) to overlapping peptides spanning E2HV was performed. Octamer bearing pins were prepared as described in Example 1. The binding of the designated serum proteins to the octamers was determined by an ELISA assay, using antibodies directed to the specific proteins. Controls were run in the absence of the serum proteins but in the presence of the respective antibodies. The results, shown as difference plots, are shown in Figs. 7A-7C. Based upon the results, it appears that transthyretin binds to at least one minimum epitope in the hypervariable region. In addition, the results are suggestive that TBG binds to two minimum epitopes, one of which encompasses the SLF--G motif.
